

TASK 1

REPORT

For this task, I used Canva to create my digital literacy infographic. I chose Canva because it is easy to use and has many ready-made templates which made my work a bit simpler. My design mainly shows what digital literacy means and why it is important for students. I included points like safe internet practices, using digital tools for study, and maintaining a professional online presence. I also tried to keep the design simple and colorful so that it looks attractive and easy to understand.

One thing I found slightly difficult was arranging all the information properly in just one page. Sometimes it felt like there was too much content and not enough space, so I had to remove some points and adjust the layout again and again. But at the same time, it was interesting to explore different templates and icons. Overall, this task helped me understand how to present information in a clear and creative way, even though it took some time to finalize the design.

TASK 2

REPORT

For this task, I created profiles on GitHub, LinkedIn, and Kaggle. Each of these platforms has a different purpose and is useful in its own way. GitHub is mainly used for storing and sharing code, and it also helps in building a project portfolio. LinkedIn is more for professional networking, where we can connect with people, see job updates, and build our professional identity. Kaggle is useful for data science and machine learning practice, where we can work on datasets and learn new skills.

Over the next four years, I plan to actively use these platforms to improve myself. On GitHub, I will upload my projects and try to maintain my profile regularly. On LinkedIn, I will update my achievements, skills, and connect with professionals. On Kaggle, I want to explore datasets and try some beginner competitions. Even though I am still learning, I think these platforms will really help me in building my career step by step.

TASK 3

REPORT

For this task, I used HackerRank for coding practice and Google Forms for creating a quiz. On HackerRank, I solved a beginner level problem which helped me understand basic logic and how coding questions actually work. At first it was a little confusing, but after trying I was able to complete it, which felt good.

For the second part, I created a Google Form with 5 questions based on digital literacy awareness. It included both multiple choice and short answer questions. I also checked the response sheet which automatically collects answers, and that was quite interesting to see.

These tools will help me academically in many ways. HackerRank will improve my coding and problem solving skills, which is important for exams and placements. Google Forms can be useful for making surveys, quizzes, and even collecting data for projects. Overall, I think these platforms are very useful for learning new skills and improving practical knowledge, even though it takes some time to get used to them.

TASK 4

REPORT

One situation where poor digital communication caused a problem is when a student emailed a professor asking for an assignment extension but wrote the email in a very casual and unclear way. The subject line was missing, and the message just said something like “I can’t submit, please extend,” without any proper explanation or respectful tone. Because of this, the professor ignored the email, thinking it was not serious or even spam.

This situation could have been handled better by writing a clear subject line, using a proper greeting, and explaining the reason politely. If the student had written in a more professional way, there is a higher chance the professor would have understood and granted the request. This shows that even small things in digital communication can make a big difference.

TASK 5

REPORT

While researching about UPI and online payment fraud, one thing that really surprised me was how easily people can get scammed just because of small mistakes. I used to think that only less educated or unaware people become victims, but actually even college students can fall into these traps. The way scammers talk and create urgency, like saying your account will be blocked or you will lose money, makes people panic and take quick decisions without thinking properly.

Another surprising thing was how fast the money gets transferred and how difficult it is to recover it after the fraud happens. It made me realize that even one wrong click or sharing OTP can cause serious loss.

One habit I will personally change is being more careful while using UPI apps. Before, I didn't always check the details properly, but now I will double check everything before sending money. Also I will never share my OTP or UPI PIN with anyone, even if they sound genuine.
